                                                                                    The sequences given in AAT00282-394 represent DNA ligands to basic fibroblast growth factor (bFGF). These sequences were isolated using the CC primers and target regions given in AAQ8421-29 using systematic CC evolution of ligands by exponential enrichment (SELEX). DNA templates CC containing a region of 30 or 40 random nucleotides flanked by constant CC sequence regions, were synthesized. The constant regions were designed to CC be amplified by the primers. The primer 397-18P has 2 biotin CC be amplified by the primers. The primer 397-18P has 2 biotin CC by terminus during synthesis. The random region was generated by CC 5' terminus during synthesis. The random region was generated by CC cutilising an equimolar mixture of the four nucleotides during oligonulisting an equimolar mixture of the four nucleotides during contain CC internal random regions. Each pool was incubated with bFGF at an excess of DNA to target. DNA bound to bFGF were selected with bFGF A significant improvement in affinity of DNA ligands was seen after 10 conds of selection. Five distinct families of sSDNA were identified, counted to the counter of the four amplified by PCR. A significant improvement in affinity of DNA ligands was seen after 10 counted to the counter of the four amplified by PCR. A service of the four that the counter of the four amplified by PCR. A significant improvement in affinity of DNA ligands was seen after 10 counter of the four counter of the four amplified by PCR. A hand on the four that the four amplified by PCR. A hand on the four that the four amplified by PCR. A service of the four that counter four afficient families of sSDNA were identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                The invention relates to a pair of oligonucleotide (ON) primers for CC amplifying the exon 1-2 region of the HLA-A locus (human leukocyte camplifying the exon 1-2 region of the HLA-A locus (human leukocyte camplifying are ADG76495 and ADG76496). Also included is a method for camplifying aregion of the HLA-A locus containing the first and second cc exons, which consists of carrying out a PCR using the above primers. Also cc consists of the HLA-A locus containing the above primers. Also cc containing the above primers also cc disclosed are HLA-A genotyping probes for exon 2 and 3 and HLA-A allele cc individual identity and identifying disease susceptible individuals e.g. cc individual identity and identifying disease susceptible individuals e.g. cc graft-versus-host disease. The method provides a rapid and precise system cc graft-versus-host disease. The method provides a rapid and precise system cc annot be distinguished by serological methods. The present sequence is cannot be distinguished by serological methods. The present sequence is that the primers amplify exons 2 and 3, not 1 and 2 as stated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                        The invention relates to new oligonuclectide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The consensus primers and typing probes AAT44733-T44906, which are based on and amplify fragments of the L1, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods. is done with probes derived from consensus sequences found in all characterised HPV sequences. Probes AAT44762-810 are examples of HPV typing probes for identifying the amplified products generated by L1 consensus primers. This sequence is a sense probe which has specificity for HPV6 and binds the large typing the sequence is a sense probe which has specificity for HPV6 and binds to the large typing the sequence is a sense probe which has specificity for HPV6 and binds the large typing t
                                                                                                         Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09-SEP-1988;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
The sequence is that of a PCR primer p2as which was used in the isolation of DNA encoding a major subunit of the Duffy blood group antigenic system, the gp-Fy proteins. The gp-Fy proteins are gp-Fy alpha and gp-Fy beta which are produced from the same gene via a mRNA splicing mechanism. It contains the major receptor by which plasmodium vivax enters red blood cells (RBC) and causes malaria. The proteins are thus useful in preventing malaria and in regulating RBC, renal and neural function. The protein or certain fragments of it, may also be used to generate antibodies, complementary peptides and drugs modelled on their tertiary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gp-FY protein; Fyb71-81; duffy blood alternative splicing; RBC; red blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          structure,
                                                                                                                                                                                                         This sequence represents a human papillomavirus (HPV) Li type-specific probe of the invention. This sequence may be used in conjuncture with Li specific primers for detecting and typing HPV. Identification and typing of HPV is important as different types of HPV pose different risks for infected individuals. HPV16 and HPV18 have been more consistently identified in higher grades of cervical dysplasia and carcinoma than other HPV types. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human papillomavirus; HPV; HPV detection; HPV typing;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is a PCR primer for the gene encoding the prostate specific antigen, and were used in the method of the invention. The method is for identifying markers for a disease state, and comprises: (a) providing a first set of peripheral blood mRNAs from one or more subjects known to one or more subjects shown to one or more subjects; (b) amplifying both sets of mRNAs to provide muclair anil smooth peripheral blood mRNAs from one or more normal subjects; (b) amplifying both sets of mRNAs to provide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primers hTSC(ex19 forward and reverse (see AAV40603 and AAV40604, respectively) are designed to amplify exon 19 of the human hTSC (see AAV40561) that codes for thiazide-sensitive Na-C1 cotransporter TSC (see AAV40561). Both primers are located within introns of hTSC. 27 Sets of specific primers (see AAV40565-V40618) were used for SSCP analysis of hTSC. Amplified products were analysed for molecular variants by electrophoresis, and identified variants were sequenced. Complete linkage of Gitelman's syndrome with TSC was demonstrated. Identification of the molecular basis of Gitelman's syndrome allows for the genetic diagnosis of this disorder. The invention provides products and methods useful for diagnosis and treatment of Gitelman's syndrome and other ion transport disorders.

The inhibitor is consecred to the perfect of the preventing the development of cancer in a patient having a consecred condition, by administering to the patient a first allele consecred to an allele of a first essential gene considered to the patient are the normal somatic consecred to the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene consecred to a sective on at least one but less than all allelic forms of the gene consecred in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be consecred in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic consecred to the products and the first gene. CC which also elicit an immune response such as asthma, lupus erythematosus, which also elicit sunding metastatic or organ-confirm cc markers is used for diagnosis (also prostatic and breast autoritis), and diseases which also elicit so multiple solutions, and disease can be used confirmating DNA is present, these primers will amplify a PCR cc of DNA. If contaminating DNA is present, these primers will amplify a PCR cc product, which can be visualised via agarose gel electrophoresis. Once CC markers been completely removed from total cell RNA, the RNA can be used contaminating the prostate of the RNA can be used contaminating DNA is present transcriptase-PCR (RT-PCR). These cc markers are differentially expressed in peripheral leukocytes between cc markers are differentially expressed in peripheral leukocytes between cc markers is used for diagnosis (also prognosis and monitoring) of contaminating metastatic or organ-confined cancers, and diseases which also elicit an immune response such as asthma, lupus erythematosus, rheumatoid arthritis, multiple sclerosis, myasthenia gravis, autoimmune thyroiditis, amyotrophic lateral sclerosis, myasthenia gravis, autoimmune creptorial tris, but especially metastatic prostatic and breast cancer. A particular use is differentially metastatic prostatic and breast cancer. A particular use is differentiating between prostatic cancer and benign cancer, by multivariate analysis of several different markers. Cancers can be treated by administering sequences antisense to sequences that canced human disease markers. The method detects a leukocyte response to a score that the fort large.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo
                                                                                                           encode human disease markers. The method detects a leukocyte response disease rather than products of diseased cells, so is suitable for lascale screening of asymptomatic subjects. Disease can be detected at early stage, when few, if any, diseased cells are present in the circulation. Analysis of blood samples eliminates the need for more invasive methods for obtaining samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 1999-591105/50

Example; Fig 11; 229pp; English.

disease, particularly coronary artery disease, but also cerebrovascular disease, coronary restenosis, and peripheral vascular disease. Conversely, a high level of HDL has protective effects against cardiovascular disease. The invention provides genetic constructs and transgenic cells and non-human animals comprising human ABC1 nucleic acids, and methods of gene therapy for the treatment or prevention of cardiovascular disease comprising the administration of an expression vector encoding ABC1 or an active fragment thereof. The invention also ABC1 gene. Human ABC1 proteins and nucleotides can be used to treat or prevent cardiovascular disease, especially coronary artery disease, cerebrovascular disease, coronary restenosis or peripheral vascular disease. They may also be used in the treatment of diseases associated with ABC1 biological activity, such as Alzheimer's disease, Niemann-Pick disease, Huntington's disease, X-linked adrenoleukodystrophy and cancer. The invention specifically excludes proteins with the exact amino acid sequences of GenBank Accession No: CAA10005.1 and X75926, and the nucleic acid with the exact sequence as GenBank Accession No: AJ012376.1. Sequences C69269-C69282 represent published and corrected versions of encompasses compounds which mimic ABC1 activity, compounds which stimulate ABC1 expression and methods of screening for such compounds further relates to methods for determining whether a patient has an increased risk for cardiovascular disease due to polymorphisms in the proteins, and plays a crucial role in cholesterol transport, particularly intracellular cholesterol trafficking in monocytes and fibroblasts, being involved in cholesterol efflux from the cell. The gene encoding ABC1 is located on chromosome 9q31, and mutations in this gene are associated with two genetic HDI (high density lipoprotein) deficiency disorders, Tangler disease (TD) and familial HDI deficiency (FHA). These diseases are distinguishable in that TD is an autosomal recessive disorder, while FHA is inherited as an autosomal dominant trait. Low levels of HDL ("good cholesterol") in the blood correlate with a high risk of cardiovascular The invention relates to the human ABC1 cholesterol transporter member of the ATP-binding cassette (ABC transporter) superfamily gene exon to nucleic acid sequences (C69120) which encode fragments for such compounds. It 1 c protein ıs

The specification CC kappa3 opioid receptor (muopioid receptor-1, KOR-3). The specification CC describes four new exons of the KOR-3 gene, which combine to yield seven CC new KOR-3 splice variants of human, mouse and rat origin. These splice CC variants are potential targets for modulating morphine analgesia and CC opioid-mediated ingestive responses. The KOR-3 polypeptide are used to CC considered compounds for opioid activity. Such compounds are potential CC analgesics or more generally agents that affect gastrointestinal CC analgesics or more generally agents that affect gastrointestinal CC systems, e.g. regulators of peristalsis. Antagonists, agonists and CC ligands of KOR-3, as well as DNA vectors expressing KOR-3-encoding CC nucleic acids, or sequences antisense to KOR-3 nucleic acids, are used to regulate morphine analgesia and body weight. The level of KOR-3 or tissue CC distribution of KOR-3 can be measured to diagnose KOR-3 related CC inherited disorders. Transgenic animals with extra copies of the KOR-3 CC gene, or with endogenous alleles deleted, are used to study loss or gain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AZ65654 to AZ69578 represent human biallelic markers from the present cinvention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification complex for the biallelic markers. The biallelic markers of the invention complex association studies and haplotyping studies chuman genome, and in complex association studies and haplotyping studies compositions and methods of the invention can also be useful for the death of identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from complex acting on a disease as well as other treatment.

CC pharmaceutical agents acting on a disease as well as other treatment.

                                                                               Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism;
                                                                                                                                                                                                                              AAF95402
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, gene analysis and phenotype correlations to diseases such as diabetes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lander

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism are pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                      15-MAR-2001

genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myccardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to disease. correlations in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin present ons to diseases. The present sequence is gene SNPS shown in the specification invention provides a method of diagnosing a vascular disease an example phenotype of one of

Sequence 21 BP; 3 A; 4 C; 6 G; 8 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, throus thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAF93032 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                         The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates IXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Partial exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-MAY-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                             Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a denotion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      single nucleotide polymorphism; SNP; single nucleotide primer extension;

                                                                                                                                        SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonuclectides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g.

                                                                                                                                                                                                                            The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic fibroblast growth factor (bFGF). The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including initiation and progression of atherosclerosis, acute coronary syndromes, vein graft disease and restenosis following coronary angioplasty. The ligands have improved

                                                                                                                                                                                                                               AAH89038
                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       receptor 1 (HCRTR1) gene. The HCRTR1 gene is present on chromosome 1, location 1p33. It is likely that a mutation in the HCRTR1 gene is associated with narcolepsy. HCRTR1 is a central nervous system modulator. The HCRTR1 polypeptide and polypucleotide are useful for diagnosing or treating narcolepsy in an individual. The HCRTR1 polypucleotide is a source of probes and primers, and is also used to produce the protein

The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-MAY-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200134840-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               determine sites correlating with phenotypic traits, and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Au

```

Disclosure; Col 69-70; 140pp; English

The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention all discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention the genome of also

PT The present sequence comprises a probe for human papillomavirus (HPV) genotyping that was used in an example of the use of hairpin probes in nucleic acid hybridisation analysis. The probe sequence is present within the 5' stem portion of an RNA-DNA probe (see ABA91521) that is capable of forming a hairpin structure. The DNA portion of the hairpin probe includes methylphosphonates. The hairpin probe is immobilised onto a membrane by BSA conjugation and the resulting probe-containing strip is contacted with HPV genomic DNA. After hybridisation, the strip is treated with HPV genomic DNA. After hybridised probe with RNA-DNA with RNase H to digest the portion of the hybridised probe with RNA-DNA structure. A second hybridisation is then performed using biotin-labelled probes, which are complementary to the portions of immobilised probe that become single-stranded after hybridisation and digestion. Biotin in the hybrid is detected by streptavidin-horseradish peroxidase conjugate

                 The invention relates to a nucleic acid comprising single nucleotide polymorphisms (SNPs) associated with diseases. The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolaemia, polycystic kidney disease, hereditary spherocytosis, Von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos conformed actropomes of the constant and colonic polyposis, Ehlers-Danlos conformed actropomes of the constant and colonic polyposis, Ehlers-Danlos conformed actropomes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            are capable of both intramolecular and intermolecular hybridisation and in which the nucleotide sequence that is complementary to the target sequence is located entirely within the double-stranded portion of the hairpin probe. The use of such probes reduces background hybridisation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chemiluminescence 7 are capable of both

New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and autoimmune diseases.

Disclosure; Page 809; 977pp; English.

cacuyAllini receptor at (ANCAL), or collegase Alliant Collegas (CLNEX), bradykinin receptor B2 (BDRRB2), anglotensin converting enzyme CC (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC polymorphic position. Also included are (I) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single comprising polymorphisms comprising additional 5' and 3' flanking genomic concluded are (I) a probe that hybridises to a comprising the sample from one or more individuals and determining the combatining the sample from one or more individuals and determining the comprising (MI) at least one nucleic acid sample comprising comprising grouping at least two nucleic acids enablotypes using the genes comprising grouping at least two nucleic acids (I) identifying (M3) an individual at risk of developing a disorder comprises one or more polymorphic positions within a gene encoding a number of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; (3) constructing (M4) an individual at comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; (3) genotyping (M4) an comprise one or more polymorphic positions within a gene encoding a nucleic acid sample, determining the comprise position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, at a least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, coronners, are and cardiovascular diseases like anglina pectoris, and sease, trachomas, and cardiovascular diseases like anglina pectoris, and artery disease, atteriosclerosis and/or atherosclerosis, and and artery disease, atteriosclerosis and/or atherosclerosis, inflammatory encoding aminopeptidase P (XPNE tachykinin receptor B1 (TACR1), The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRE1) polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chromobstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The but is not referred to anywhere C1 esterase inhibitor (ClNH), else in the specification kallikrein Chronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AILIM-expressing cells, and for inducing antibody-dependent cytotoxicity against AILIM-expressing cells and/or immune cytolysis or apoptosis of AILIM-expressing cells. (I) is useful for treating, preventing or prophylaxis of delayed type allergy. (I) is useful for treating and preventing various diseases associated with AILIM-mediated costimulatory transduction, and for inhibiting the onset and/or advancement of the diseases. (I) is useful for suppression, prevention and/or treatment of rheumatoid arthritis, multiple sclerosis, autoimmune thyroiditis, allergic contact-type dermaticis, chronic inflammatory dermatosis, allergic contact-type dermaticis, chronic inflammatory dermatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          systemic lupus crythematosus, insulin-dependent diabetes mellitus, psoriasis, autoimmune or allergic disorders, inflammation, graft versus host reaction, graft versus host disease, immune rejection, disorders caused by abnormal intestinal immunity, specifically inflammatory intestinal disorders such as ulcerative collitis, pneumonia, hepatitis, nephritis, vasculitis, and pancreatitis. (I) induces no serious immunorejection due to antigenicity to human, i.e., human anti-mouse antigenicity (HAMA) in a host. AAS99444-AAS99477 represent anti-human AILIM monoclonal antibody coding sequences and PCR primers of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (AILIM). (I) is useful for modulating signal transduction into a cell mediated by AILIM, for modulating proliferation of AILIM-expressing cells, for modulating production of a cytokine from the contraction of a cytokine from the cytokine from th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates

                                                                                                                        English.
```

mutants with modified protein production capabilities. The invention alf relates to methods for the treatment and prevention of infectious diseases. The methods and compositions of the invention are useful for vaccinating and treating infections in particular mycobacterial diseases such as tuberculosis and Crohn's diseases. The invention is also used in gene therapy. The present sequence is a PCR primer used for amplifying Mycobacterium sp. hsp70 (heat shock protein 70) operon promoter. This sequence is used to illustrate the method of the invention Sequence 21 BP; 4 A; 5 C; 8 G; 4 T; 0 ₽ 0 Other diseases also

Diagnosing and/or determining a predisposition to a cellular proliferative disorder of breast tissue, in particular breast can determining the state of methylation of one or more nucleic acids from the subject cancer, γď

Page 44; 115pp; English

The present invention relates to a method of diagnosing a cellular proliferative disorder of breast tissue, which involves determining the state of methylation of one or more nucleic acids isolated from the subject, where the state of methylation of the nucleic acids as compared with a state of methylation from a subject not having the cellular proliferative disorder of breast tissue is indicative of a cellular

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proliferative disorder of breast tissue in the subject. The nucleic acids may be TWIST, HOXA5, NES-1, retinoic acid receptor beta (RARbeta), oestrogen receptor, cyclin D2, Wilms' tumour gene (WT-1), 14.3.3 sigma, HIN-1 or RASSF1A. The method is useful for diagnosing and/or determining a predisposition to a cellular proliferative disorder, in particular breast cancer including ductal carcinoma in situ, lobular carcinoma, colloid carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma, intraductal carcinoma, medullary carcinoma in situ and papillary carcinoma in situ. The present sequence is a primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23-DEC-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a recombinant dimethyl sulphide (DMS):acceptor oxidoreductase (I) or its subunit selected from recombinant alpha, beta, delta and gamma subunits. (I) is useful for oxidising prochiral organic sulphides to form sulphoxide enantiomers for chiral drug synthesis. (I) susphides to form sulphoxide enantiomers for chiral drug synthesis. (I) is expressed in a transformed bacterium. The enantiomer formed is useful for producing a chiral drug. (I) is useful for synthesis of optically-active functional groups of drug. DNA encoding (I) is useful for producing a strain of DMS:acceptor oxidoreductase-deficient Rhodovulum sulfidophilum, which is useful in whole-cell reaction, where DMS:acceptor oxidoreductase activity is unwanted. ABK53751-ABK53805 represent R. sulfidophilum DMS:acceptor oxidoreductase subunit coding sequences and both productase activity is unwanted. ABK53751-ABK53805 represent R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant dimethyl sulfide:acceptor oxidoreductase or its subunits, useful for oxidizing prochiral organic sulfides to form sulfoxide enantiomers for chiral drug synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2002-280922/32

CC signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) cor (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (C (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a comblecular variant gene comprising (I) is useful for identifying and comblecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying and obtaining an inhibitor of the cortivity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and composition for treating and obtaining an inhibitor of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and composition for treating a cardiovascular disease such as pharmaceutical composition for treating a cardiovascular disease such as composition for treating a cardiovascular disease such as pharmaceutical composition for treating a cardiovascular disease such as composition system are useful for preparation of a pharmaceutical composition for treating a cardiovascular disease such as composition system are useful as forensic markers, for comprising polymucleotides, genes, vectors, polypeptides, antibodies or comprising polymucleotides, genes, vectors, polypeptides, antibodies or comprising polymucleotides, genes, vectors, polypeptides, antibodies or condition and cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding pathway conditions are cardiovascular regulator proteins of the EDN/EDNR signaling pathway conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) crossing enzyme (ECE)/receptors of EDN and ECE (EDNR) cc signaling system which is associated with a cardiovascular disease. (I) crowariant gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) crowariant polypeptide which is associated with a cardiovascular disease. (I), (III), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a molecular content year or drug capable of expressing and expressing and expressing a molecular variant gene comprising (I) is useful for identifying and content are arrived to family a product of the EDN/ECE signaling system crowariant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and continuity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and continuity of a molecular variant of a polypeptide of the EDN/EDNE/ECE comparation or its gene product. The isolated proteins and continuity heart disease, hypertension, atherosclerosis, or related to polymucleotides encoding them are useful for preparation of a coronary heart disease, hypertension, atherosclerosis, or related to hypercholesterolaemia. The gene or a polymucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support constraint of the invention. This sequence represents a PCR primer used constraints of the invention. This sequence represents a PCR primer used constraints of the invention of the confidency and the confidency confidency and the confidency and the

CC The sequences given in ABQ80119-35 represent probes which were used to ci identify wild type and variant loci in the human interleukin 4 receptor CC (IL4R). These probe sequences were used in the method of the invention CC comprises detecting an individual's risk for type 1 diabetes. The method CC comprises detecting the presence of an insulin dependent diabetes CC mellitus (IDDM)-associated interleukin 4 receptor allele in a nucleic comprise of the individual, where the presence of the allele indicates CC more single nucleotide polymorphism (SNP) within the IL4R gene listed in CC individual's risk for type 1 diabetes. The method identifies one or CC more single nucleotide polymorphism (SNP) within the IL4R gene listed in CC individual's risk for type 1 diabetes. The IL4R SNPs are also useful for CC determining an individuals risk for any autoimmune disease or condition CC or any T helper type 1 mediated disease, e.g. Theumatoid arthritis, CC erythematosus, psoriasis, scleroderma, Grave's disease, systemic lupus CC conditions, myasthenia gravis, Guillain-Barre syndrome, or Hashimoto's cc thyroiditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus-associated interleukin 4 receptor allele in a nucleic acid sample of the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; Page 32; 79pp; English.

These probe sequences were used in the method of the invention CC for determining an individual's risk for type 1 diabetes. The method CC comprises detecting the presence of an insulin dependent diabetes CC mellitus (IDDM)-associated interleukin 4 receptor allele in a nucleic card sample of the individual, where the presence of the allele indicates CC the individual's risk for type 1 diabetes. The method identifies one or CC more single nucleotide polymorphism (SNP) within the IIAR gene listed in CC individual's risk for type 1 diabetes. The IIAR SNP's are useful for determining an individual's risk for any autoimmune disease or condition CC determining an individual's risk for any autoimmune disease or condition CC cor any T helper type 1 mediated disease, e.g. rheumatoid arthritis, CC multiple sclerosis, inflammatory bowel disease, systemic lupus correct control of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus-associated interleukin 4 receptor allele in a nucleic acid sample of the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 4; Page 36; 79pp; English
